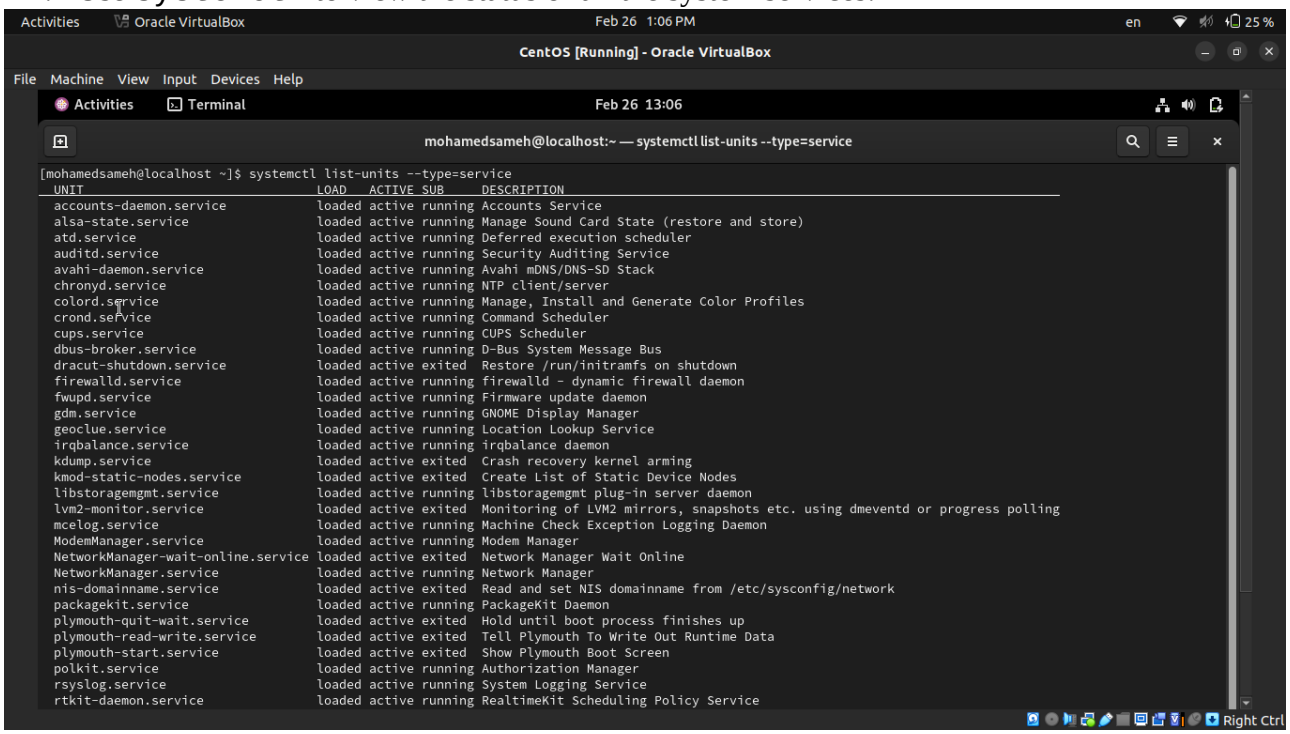
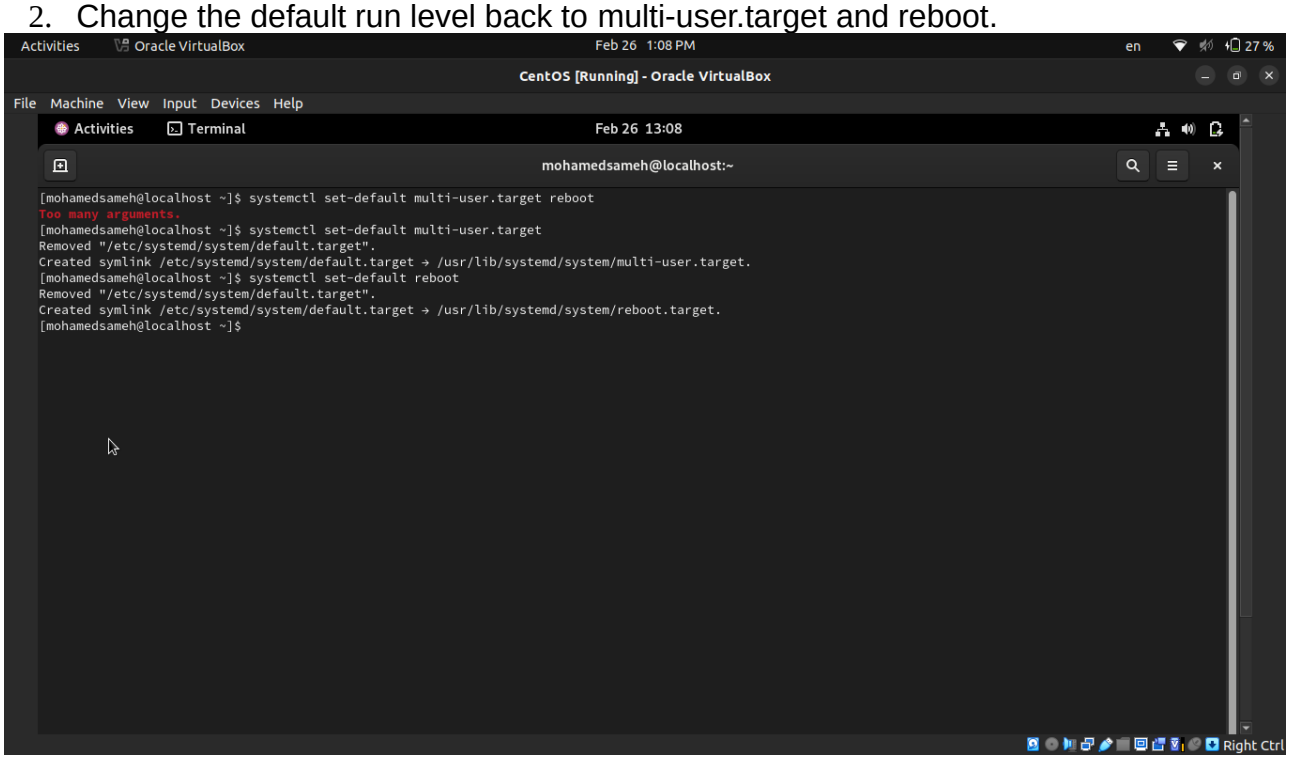
Mohamed Sameh Elkholy
RHSA2 - Lab 1

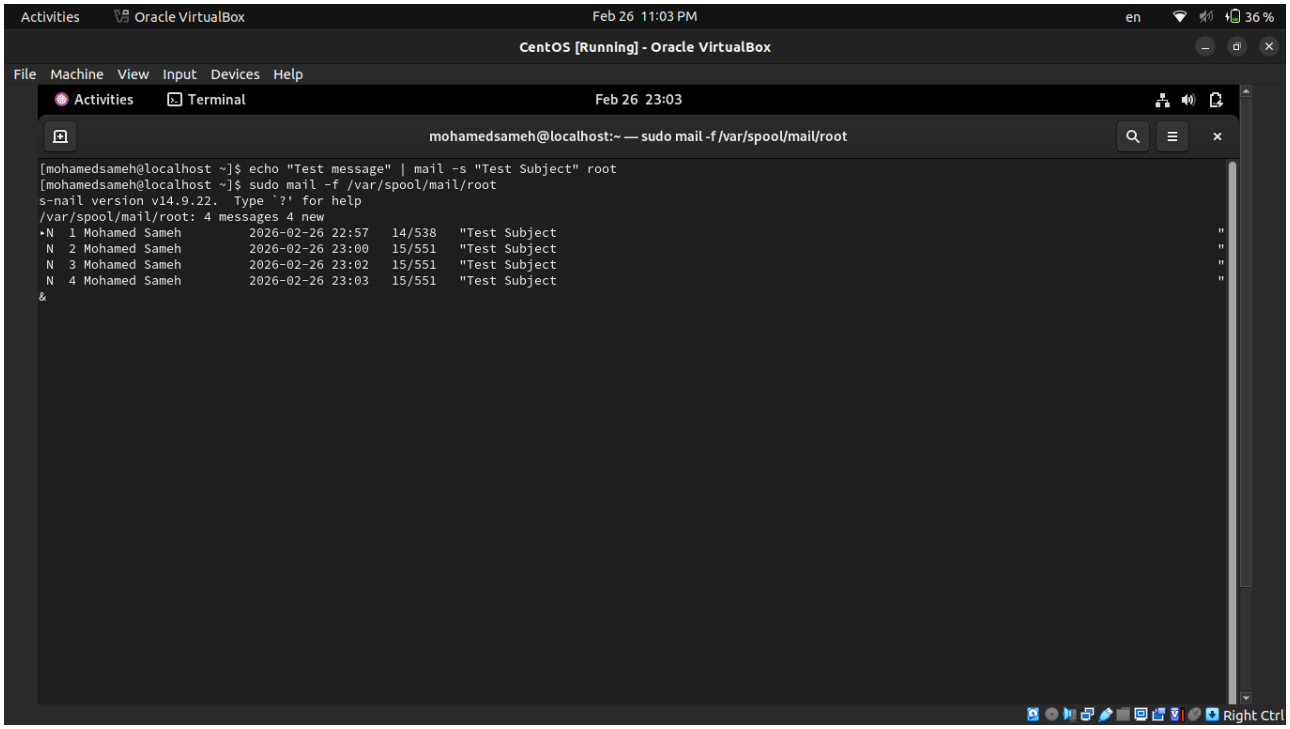
1. Use `systemctl` to view the status of all the system services.



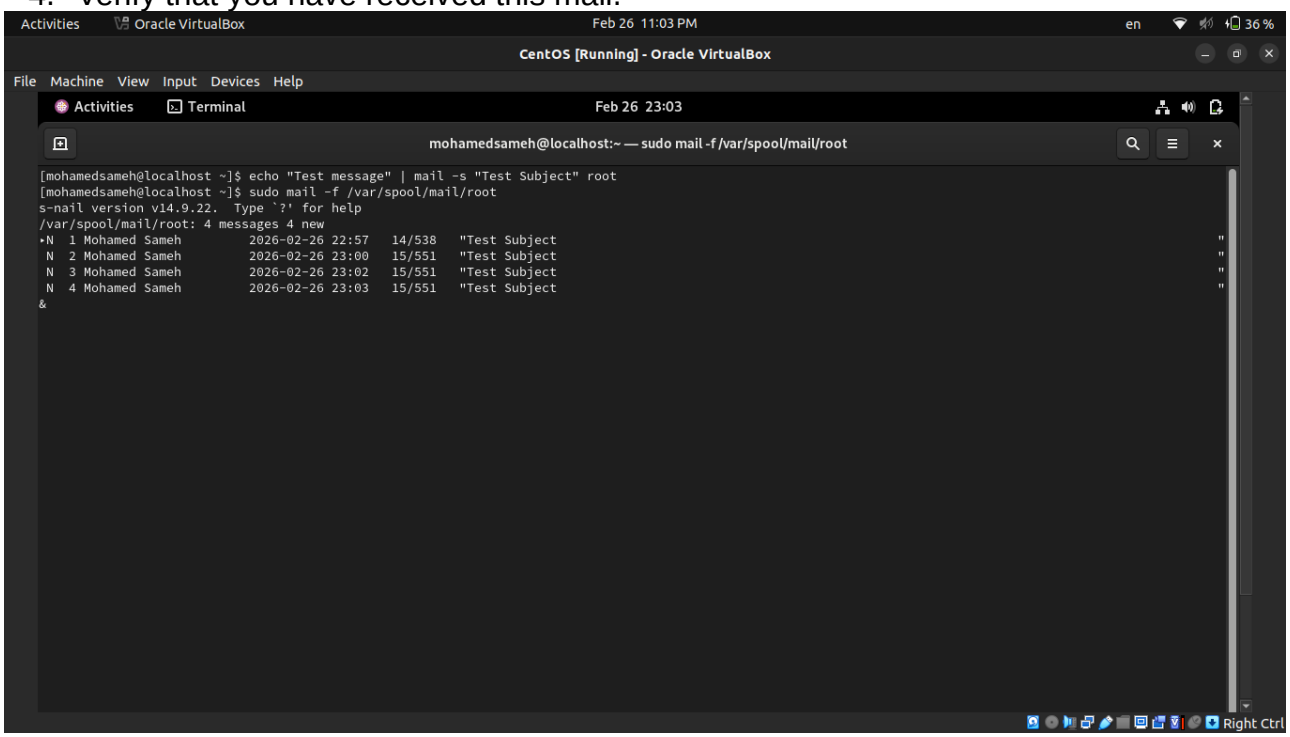
2. Change the default run level back to multi-user.target and reboot.



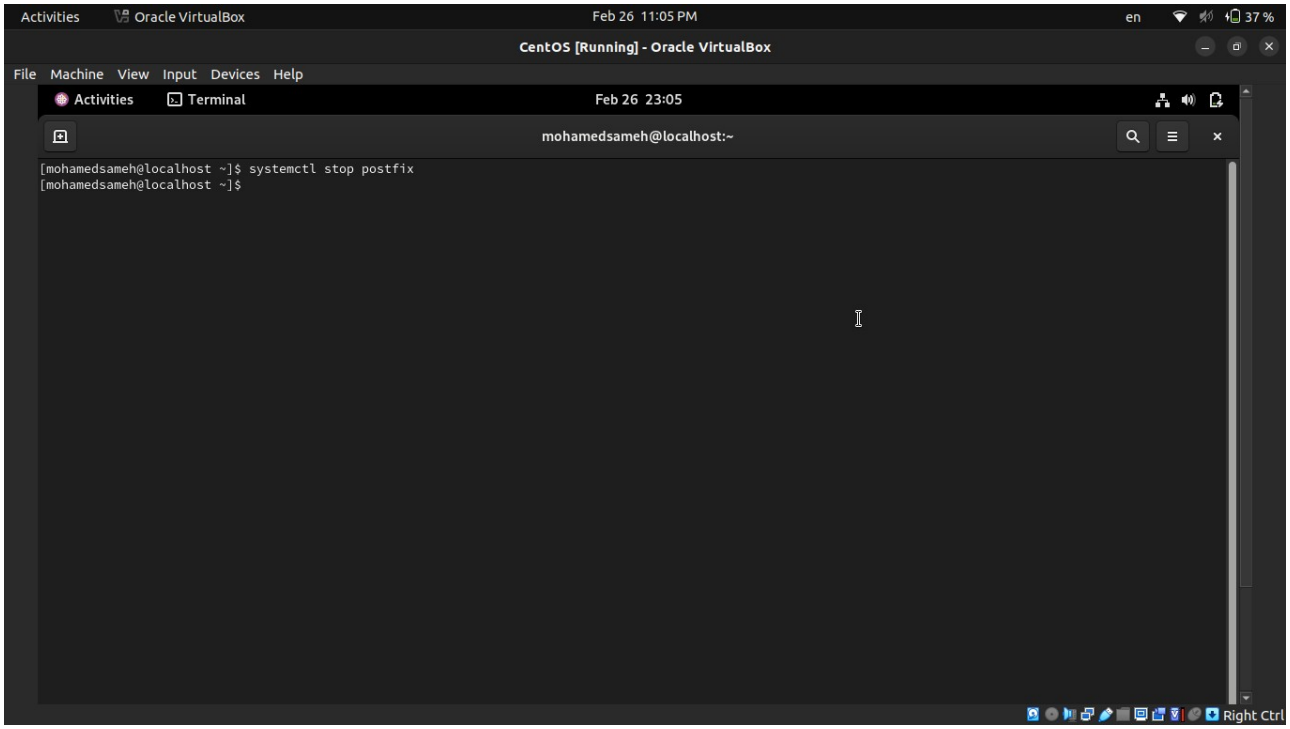
3. Send mail to the root user.



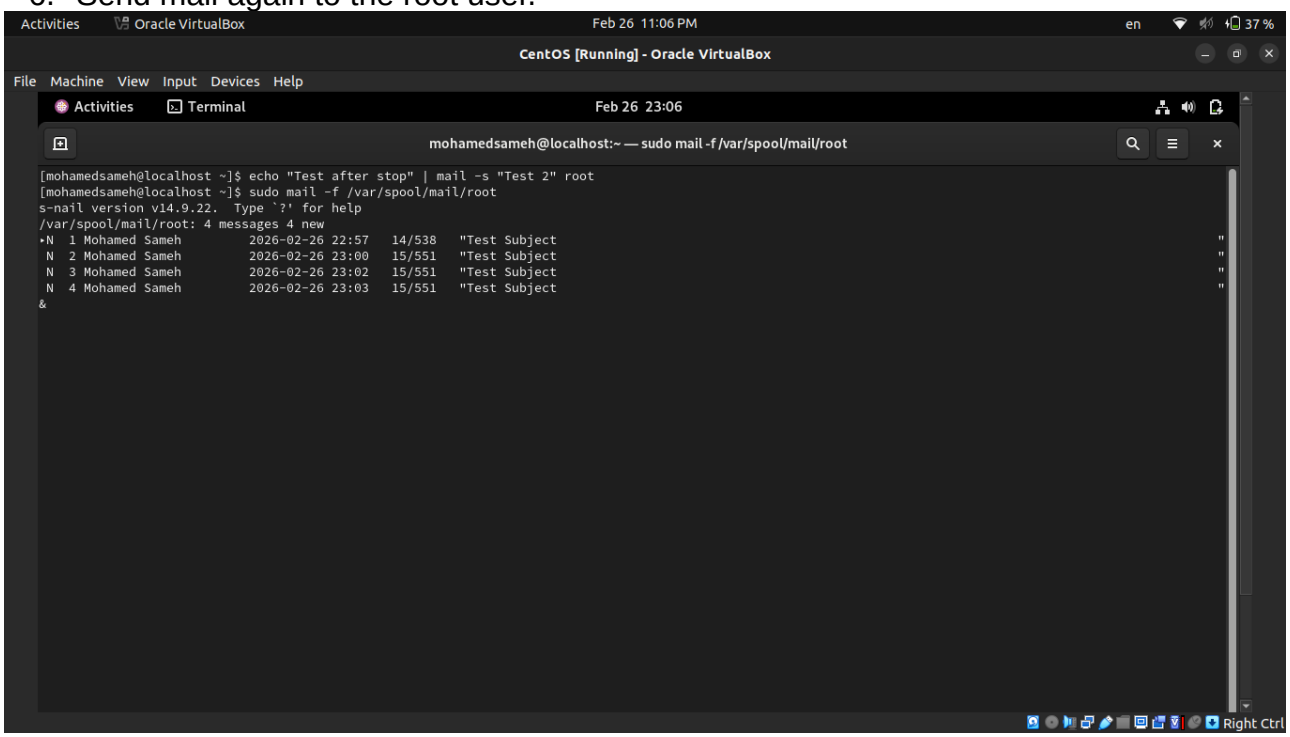
4. Verify that you have received this mail.



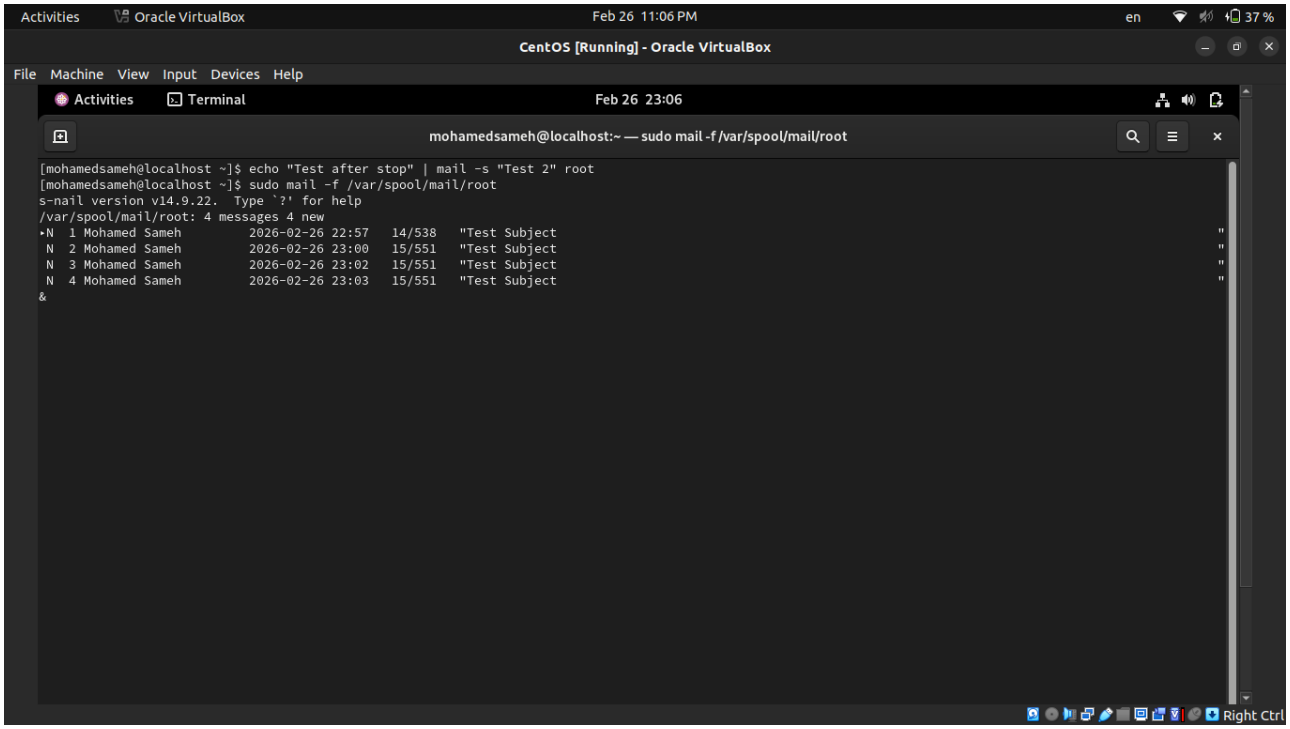
5. Use `systemctl` utility to stop `postfix` service



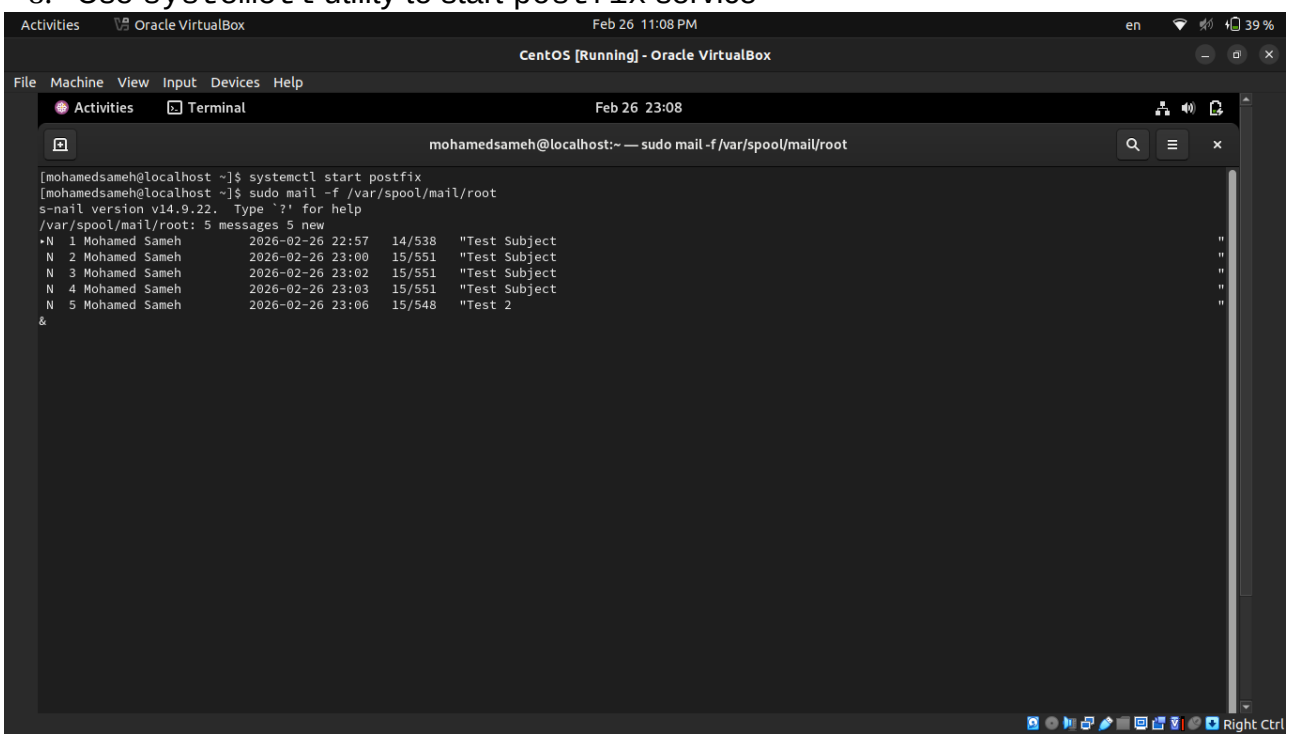
6. Send mail again to the root user.



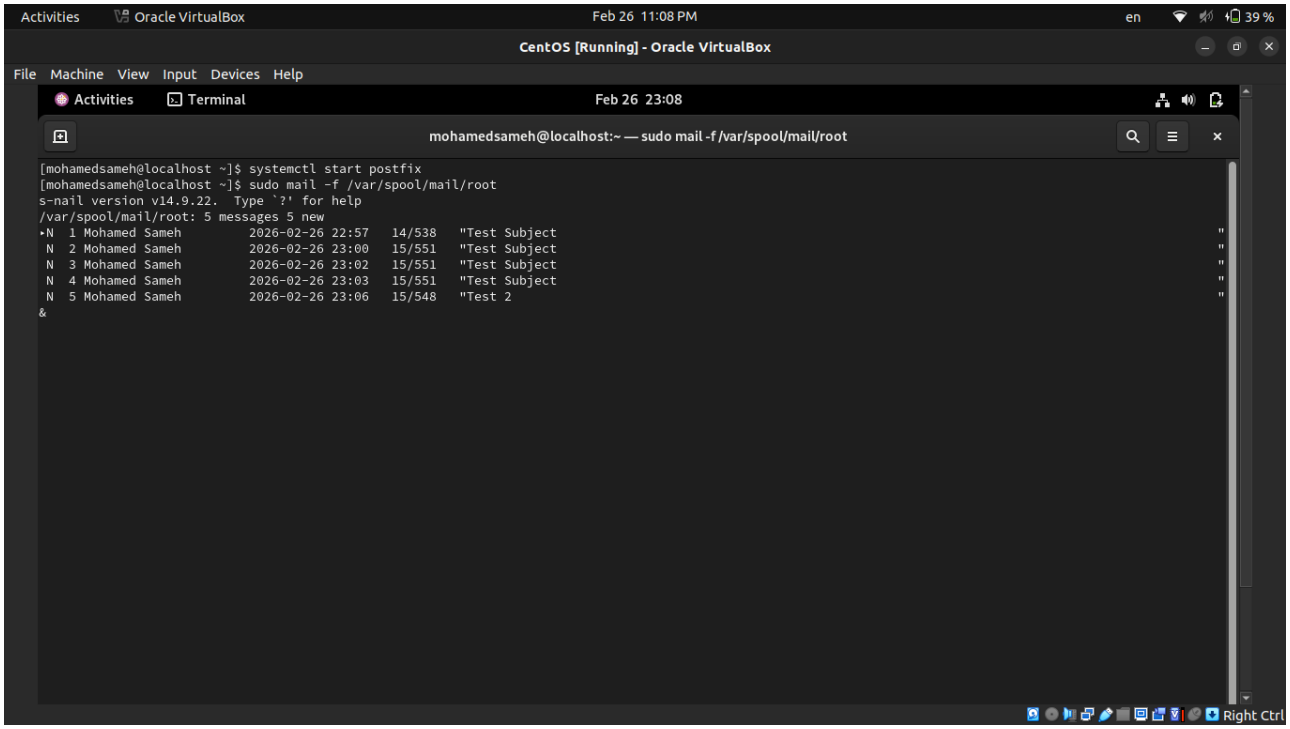
7. Verify that you have received this mail.



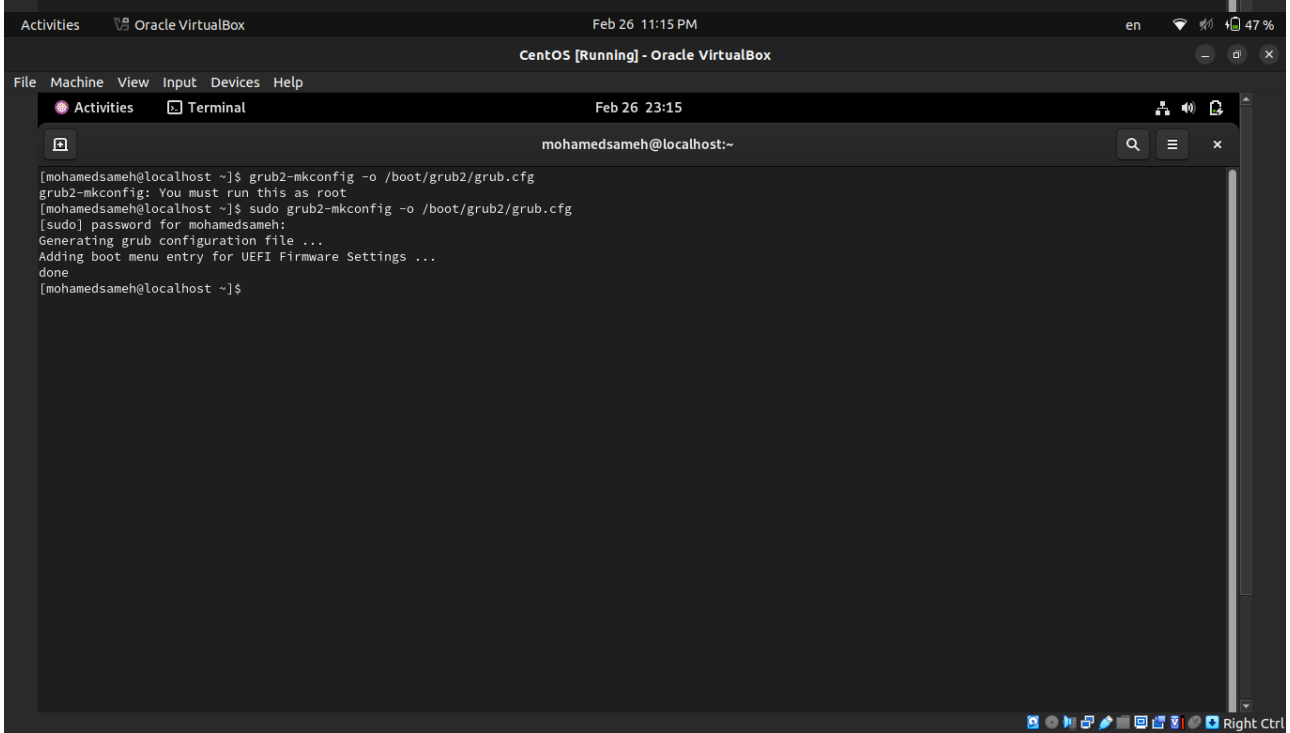
8. Use `systemctl` utility to start `postfix` service



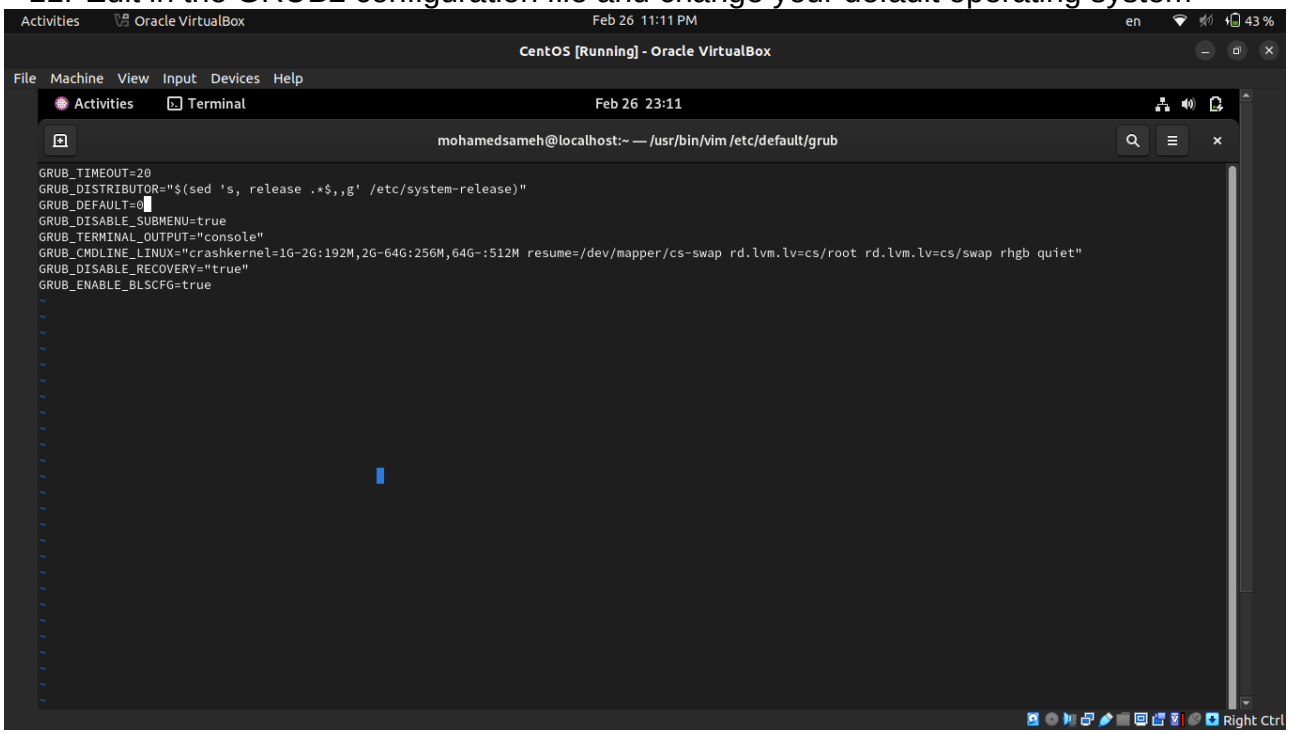
9. Verify that you have received this mail.

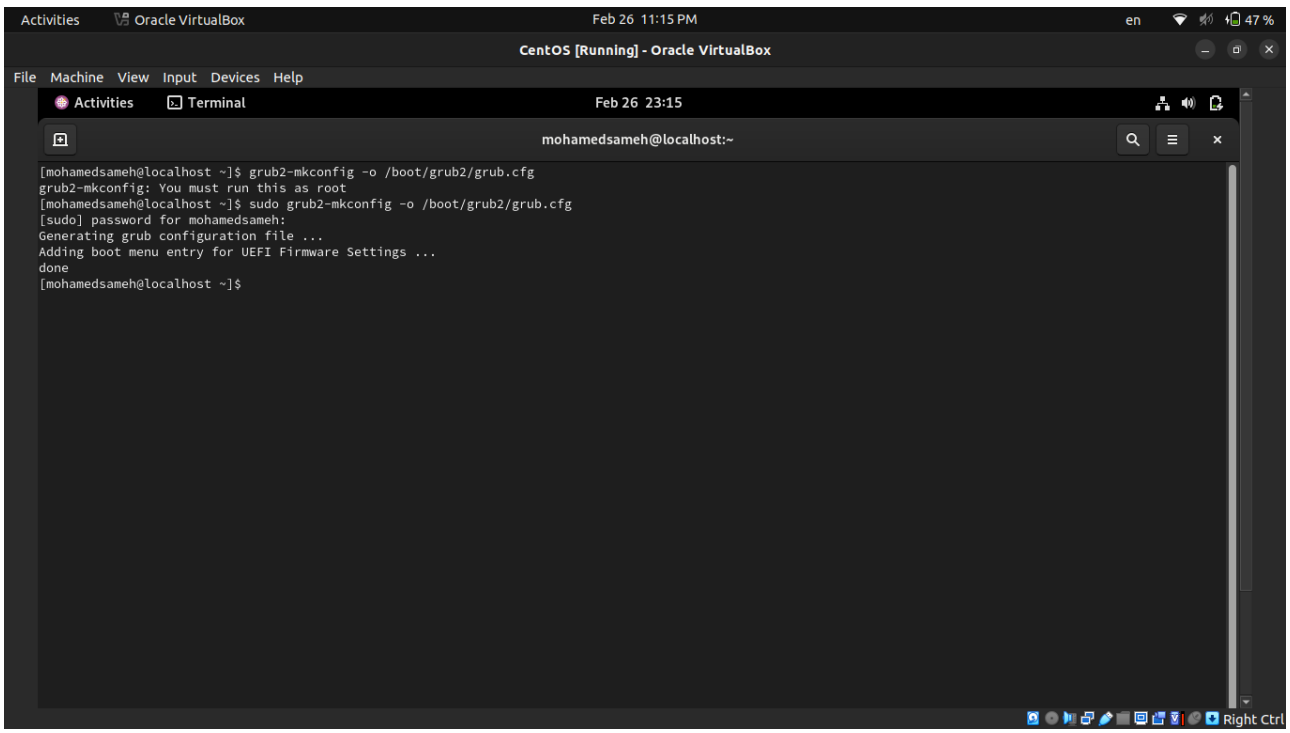


10. Edit in the GRUB2 configuration file and change the timeout variable equal 20 seconds.

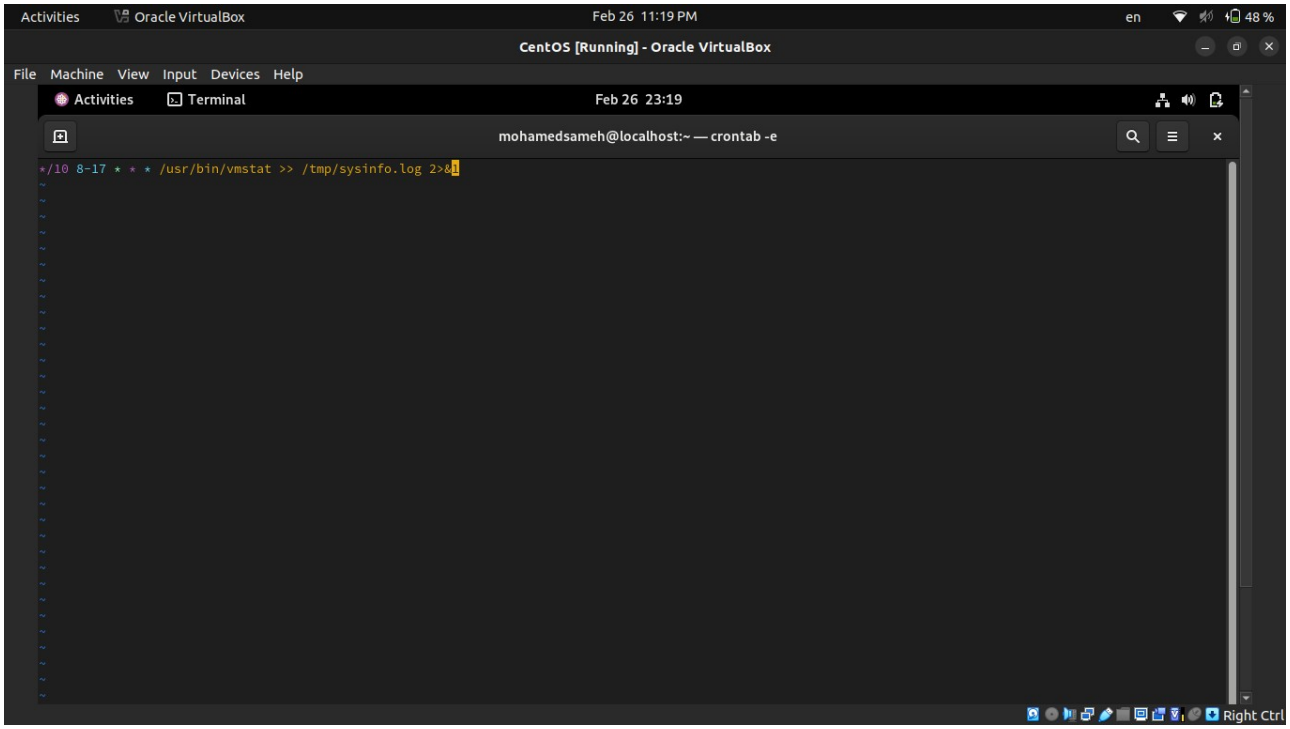


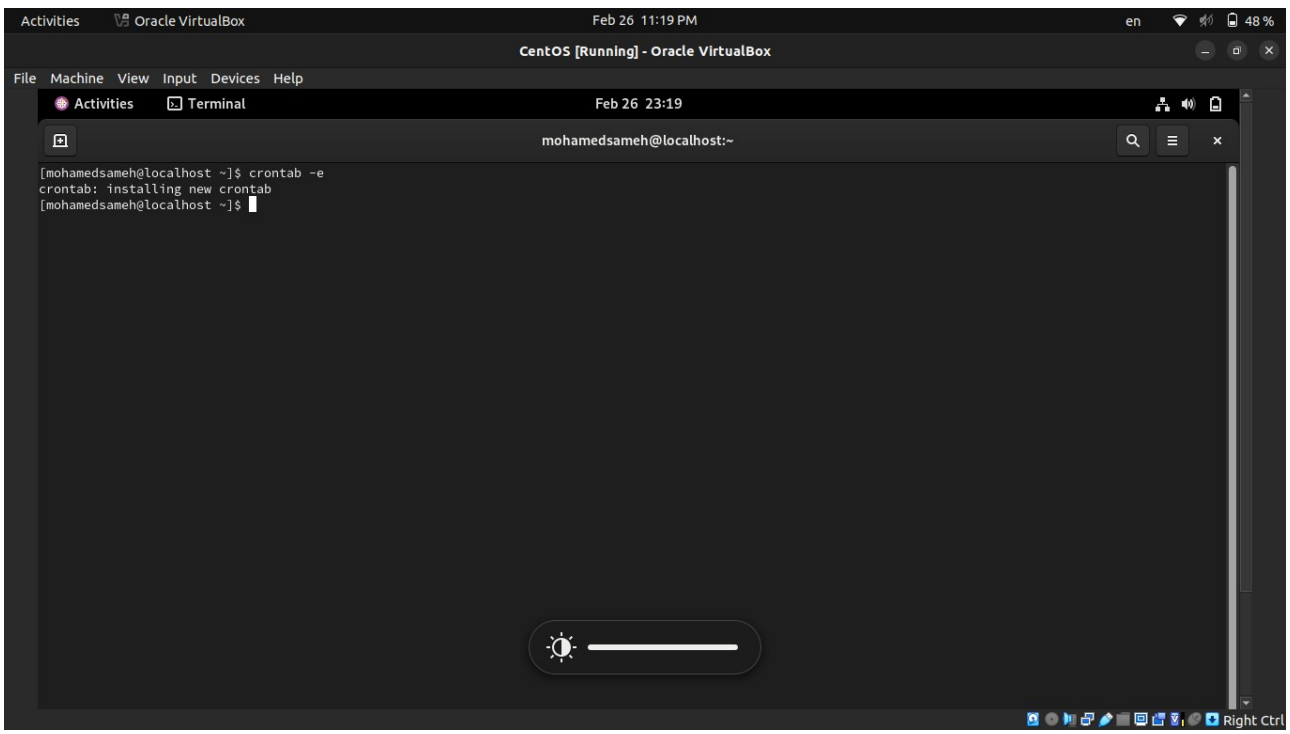
11. Edit in the GRUB2 configuration file and change your default operating system



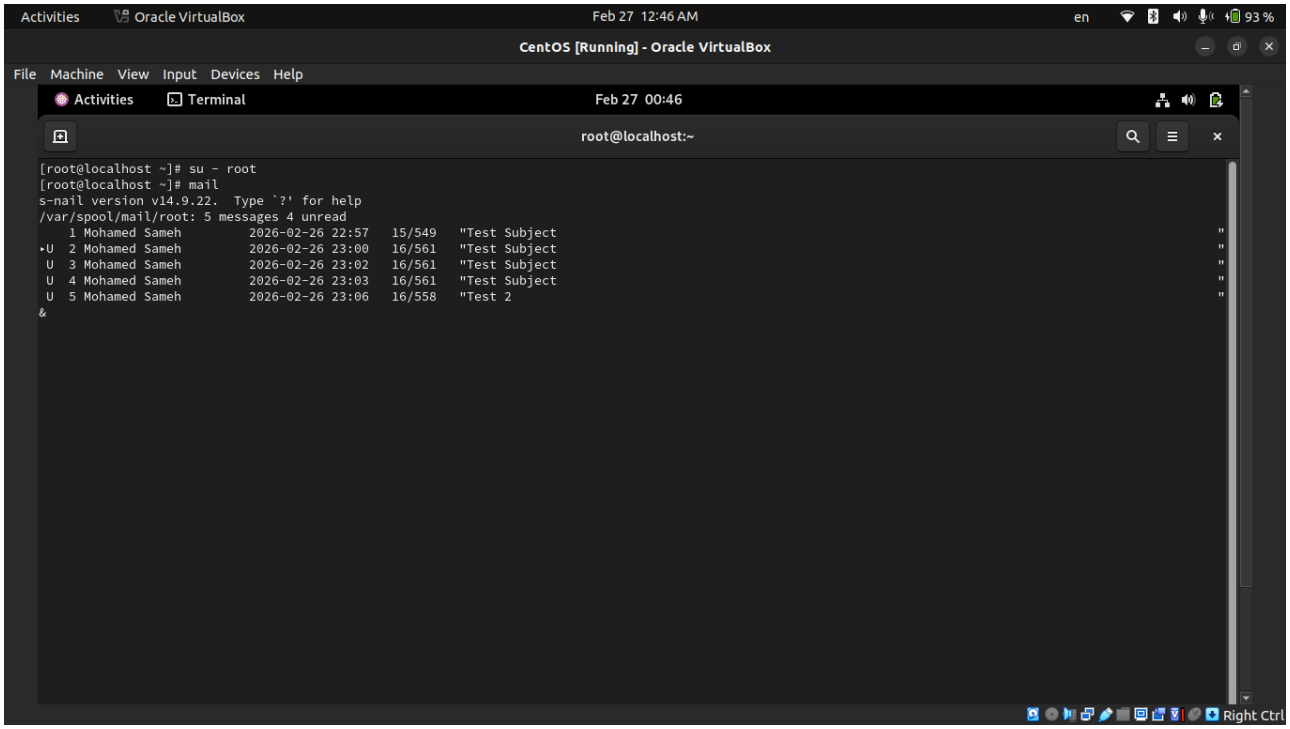


12. You want to know some information about the status of the system every ten minutes today between the hours of 8:00 AM and 5:00 PM. to help investigate some performance issues you have been having. You suspect it might be memory related and want to keep an eye on those resources.

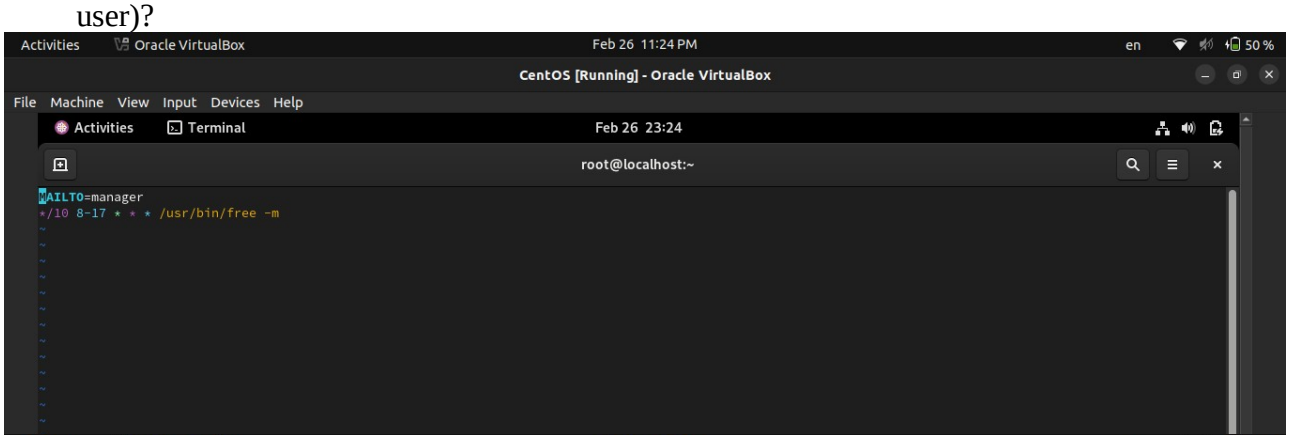


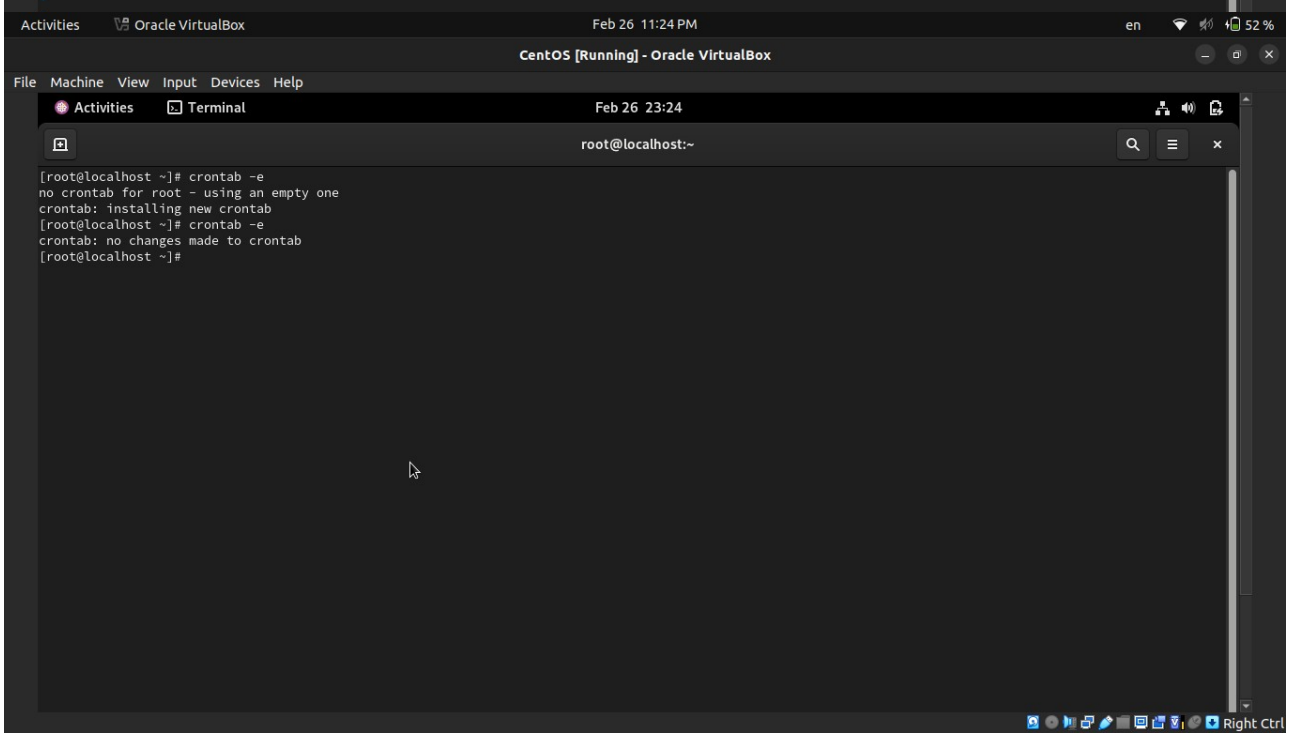


13. Use mail as the root user to check for e-mail from the cron jobs you have scheduled.

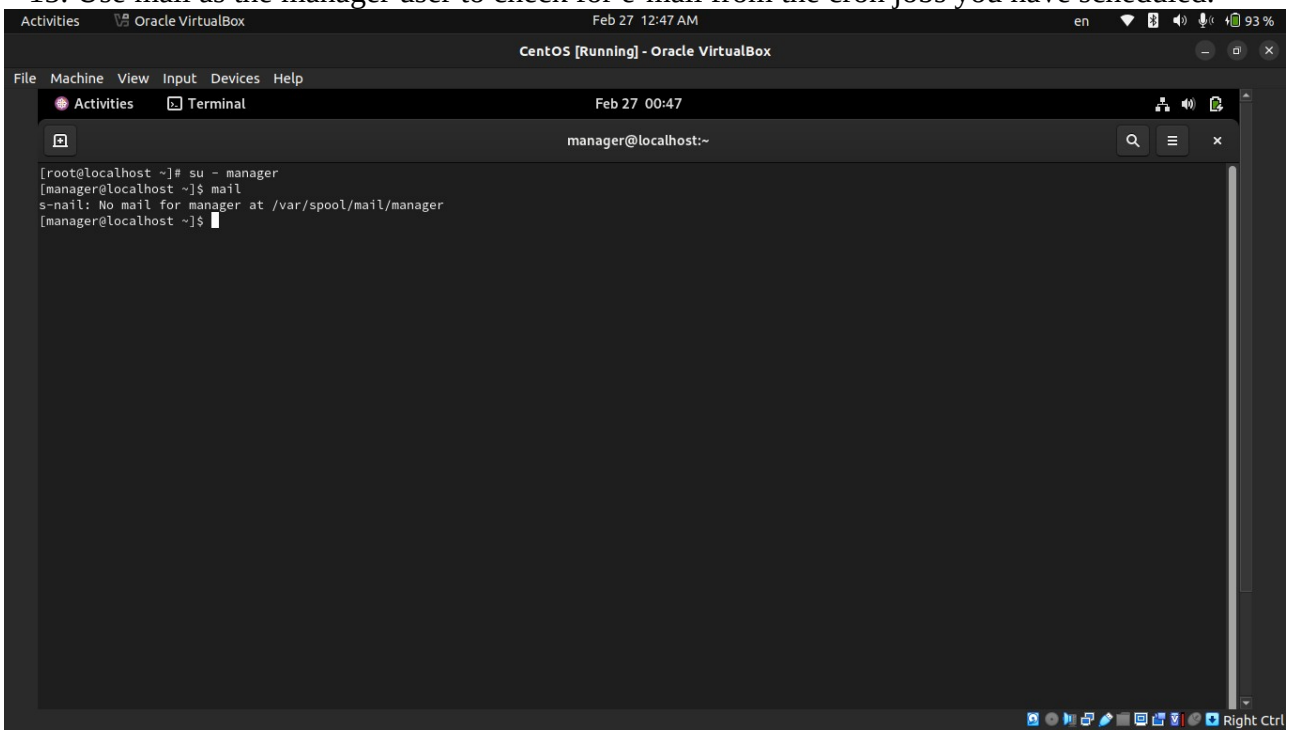


14. How could you send the output from these cron jobs to another e-mail address (the manager user)?





15. Use mail as the manager user to check for e-mail from the cron jobs you have scheduled.



16. Grand your colleagues a collective directory called /opt/research, where they can store generated research results. Only members of group profs and grads should be able to create new files in the directory, and new file should have the following properties:
    - the directory should be owned by root
    - new files should be group owned by group grads
    - group profs should automatically have read/write access to new files
    - group interns should automatically have read only access to new files
    - other users should not be able to access the directory and its contents at all.
